

Figure 6-7: Tracing Data Access classes to analysis classes.

Data Layer Classes. Define the Data Access Layer of the system. The DAL classes decouple the data access from the business logic. These classes implement the data access operations needed by the system.

Data Type Classes. The utility classes are .NET-generated DataSet classes that provide an interface to rows of data both to and from the database.

The Key Abstractions entities are high-level entity elements that correspond to persistent entities that the system manages.
