The **Introspector** facility in WURFL 1.4 is an HTTP endpoint built right into the library that allows you to query the WURFL engine remotely. The Introspector logic is contained in the **wurfl.aspnet.extensions** DLL but it requires a public endpoint to be accessible.

Steps to set up your WURFL-enabled ASP.NET web site:

1) Add a reference to the **wurfl.aspnet.extensions** DLL
2) Place the **introspector.ashx** file you get with the package in a publicly accessible location of the site that suits you—for example, you can place it in the root of the site.

When invoked the introspector displays a simple user interface for you to get information about the installed version of the WURFL database and API. You can also query the introspector about specific user agent strings.
