

Utilizing Alternative Printing Options

The Print module in Lightroom also includes several alternative printing options, such as the ability to print in draft mode, print to a 16-bit printer, and create a JPEG file of a print layout.

Print in Draft Mode

If saving time is more important to you than producing high-quality prints, you can enable Draft Mode Printing. With this mode, Lightroom reads the image data from the image previews, which doesn't take as long to process.

1. With a multipage layout already set up in the Print module, choose Window, Panels, Print Job to display the Print Job panel.
2. At the top of the Print Job panel, choose Printer from the Print To dropdown list.
3. Enable the Draft Mode Printing option in the Print Job panel.
4. Choose File, Print or click the Print button located in the lower-right corner of the interface.
5. In the Print dialog box, click Print.

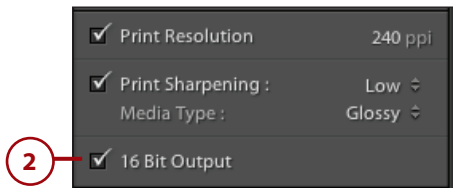

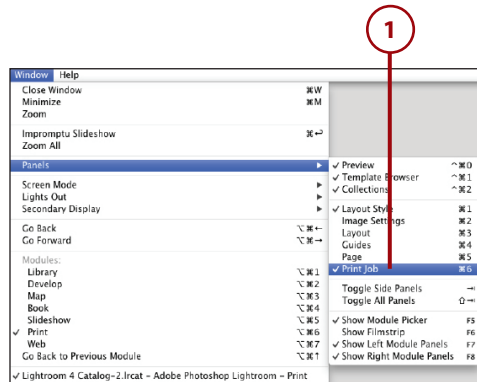

Render 1:1 Previews

To generate better-quality Draft Mode prints, choose Library, Previews, Render 1:1 Previews prior to printing.

Print 16-Bit Images

Most inkjet printers are only capable of reading 8-bit image data, but there are a few models, such as the Canon ipf5000, that are now enabled for 16-bit printing. Recognizing this new and emerging technology, Adobe has included a 16-bit Output feature in Lightroom. To take advantage of this feature (provided you already have a 16-bit-enabled printer), you must enable the 16-bit Output option in the Print Job panel.

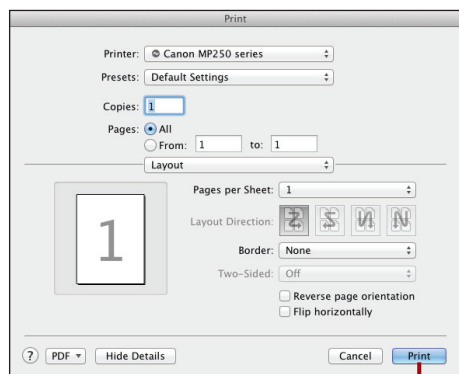

1. With a print layout already set up in the Print module, choose Window, Panels, Print Job to display the Print Job panel.

Keyboard Shortcuts

Press Cmd+6 (Mac) or Ctrl+6 (Win) to show or hide the Print Job panel quickly.

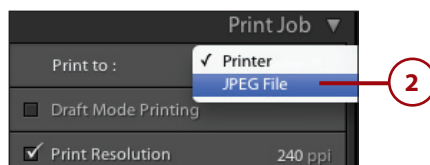

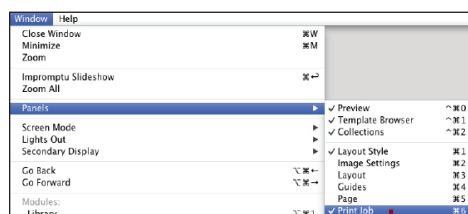

2. Enable the 16-Bit Output option in the Print Job dialog box.
3. Choose File, Print or click the Print button in the lower-right corner of the interface.
4. In the Print dialog box, choose the preferred print settings and click Print.

Print to JPEG File

The Print to JPEG feature enables you to generate JPEG images of your contact sheets rather than sending the data to a printer. This feature is especially useful for creating contact sheets that you can email to a client, or for creating JPEG print files of individual photos that others can share and print from.

1. With a print layout already set up in the Print module, choose Window, Panels, Print Job to display the Print Job panel.

Keyboard Shortcuts

Press Cmd+6 (Mac) or Ctrl+6 (Win) to show or hide the Print Job panel quickly.

2. At the top of the Print Job dialog box, choose JPEG File from the Print to drop-down list.
3. Adjust the JPEG Quality slider in the Print Job dialog box to determine the quality of JPEG compression to apply.
4. Choose File, Print or click the Print to File button in the lower-right corner of the interface.
5. In the Print dialog box, enter a name for the JPEG file in the Save As field.
6. Choose a save location for the JPEG file on your system.
7. Click Save.
