

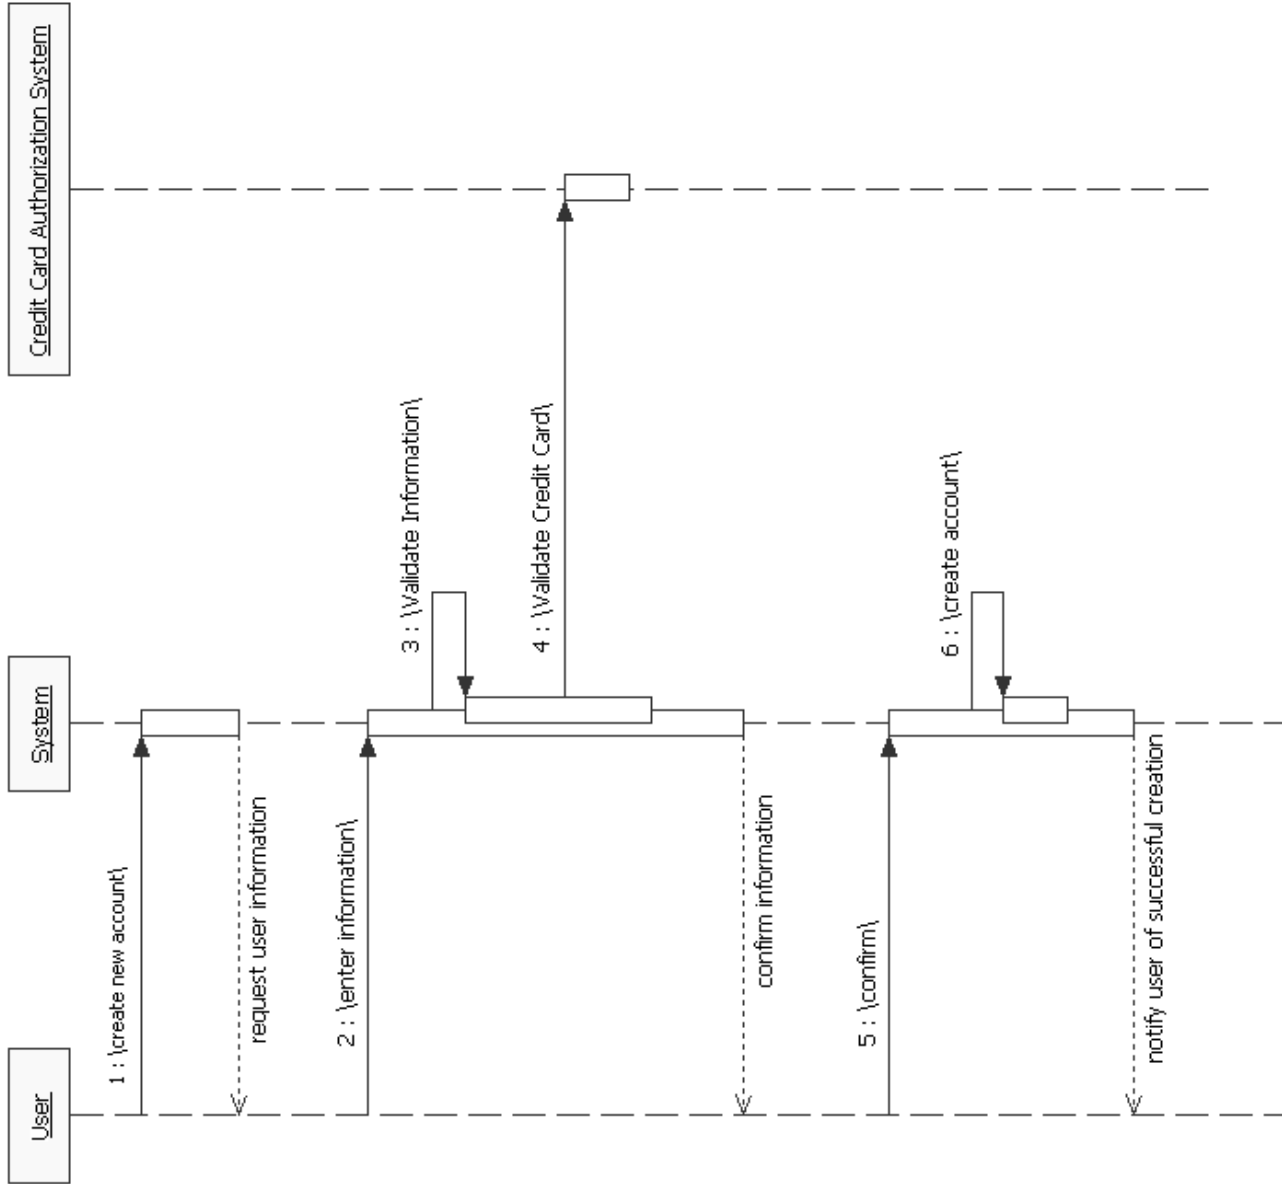

Figure 3-10: Sequence diagram of Create Account use case.

Page: 66

This use case starts when the User indicates to the system that he/she wishes to create an account.

The system displays the User Information that needs to be entered for the User.

The User enters the required User Information values and requests that the system save the entered values.

The system validates the entered User Information.

The system also validates the Credit Card by submitting a Credit Card validation request to the Credit Card Authorization System.

The system then displays the entered information and asks the User to confirm that an account should be created with the entered values.

The User confirms that an account should be created.

A new account is created and activated for the User. The entered User Information is stored in the User's new account.

The system signs in the User under the newly created account. The system notifies the User that his/her account has been activated and that the new values have been saved.
